

SSI Track Flow Chart

Medical Evidence

WFSW or Incapacity Specialist, as decided locally:

- Authorizes chart notes back to the original diagnosis by a physician
- Can authorize psychological exams & tests if the person has never worked with a psychologist or psychiatrist before.
- Can authorize exams and tests requested by the contracted physician

SSIF can authorize exams and tests overlooked during the SSI application process and needed for an SSI reconsideration

Our goal is long-term plans and specialized services for parents with chronic and severe medical conditions.

- DVR does not interfere with SSI and can help motivated parents enter the workforce.
- SSI provides more income, on a long-term basis, and can support employment. It continues once the parent's children leave home.

SSI Track (XB) cases include parents with chronic and severe physical, mental or emotional conditions:

- Condition expected to last 12 months or more.
- Medical evidence shows the parent can participate 10 hours or less per week.

Can add additional eJAS component codes to the IRP:

- XG or XM to require treatment that may help the parent's condition improve.
- XD to indicate the parent wants to work and has been referred to DVR.
- XD to report regularly scheduled one-on-one time with the parent's DVR counselor.
- Other codes to reflect activities in the parent's DVR Plan.

If it is determined the parent is unlikely to qualify for SSI, refer back to a WFSW as:

- ZD when the medical condition is not amenable to treatment.
- XG or XM when treatment is helpful, available and required.
